

Table 1: Drafted Workers and Replacement Margins

Panel A. Replacement margins					
	Total internal	Same section	Same dept.	Diff. dept.	New hires
No. drafted workers	0.4079*** (0.0761)	0.2269*** (0.0730)	0.1001** (0.0403)	0.0809*** (0.0154)	0.2057** (0.0998)
Panel B. Geographic benchmark for internal replacements					
	Total internal	≤ 2 km	> 2 km	Unknown dist.	New hires
No. drafted workers	0.4079*** (0.0761)	0.2506*** (0.0860)	0.0780 (0.0529)	0.0793 (0.0642)	0.2057** (0.0998)
Observations			7,409		
Year FE			Yes		
Section FE			Yes		
Position FE			Yes		
Log cumulative male baseline			Yes		

Notes: OLS regressions. Unit of observation: destination office $\times$ kakari $\times$ occupation $\times$ year, 1938–1945. Each cell reports the coefficient on the number of drafted male workers in the same destination kakari-occupation-year. “Same section” counts workers retained in the same ka group. “Same dept.” counts workers from a different ka group within the same normalized kyoku group. “Diff. dept.” counts workers from a different normalized kyoku group. “Total internal” is the sum of same section, same department, and different department. Panel B splits the same internal replacements by great-circle distance between prior-year and current-year office ward centroids, using the cached office-ward assignment file in Replacements/MainResults/DescriptiveData. New hires follow Table7_NewHires.R and exclude first observed office-years. All specifications include year, section, and position fixed effects, and control for log cumulative male baseline employment. Standard errors clustered by office in parentheses. *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$.
