

Table 1: Stretch and Misallocation by Relative Draftee Wage

	Position-rank boost (1)	Court-rank boost (2)	Salary increase (3)	Salary change (4)
Low relative-wage draftee destination	0.0871*** (0.0273)	-0.0064 (0.0065)	-0.2359 (0.1688)	4.1055 (22.5845)
Female	0.0383 (0.1216)	-0.0087 (0.0097)		
Tenure (yrs)	-0.0052 (0.0033)	-0.0005 (0.0005)	-0.0379* (0.0215)	-1.7473 (3.6480)
Baseline position rank	-0.6099*** (0.0800)			
Baseline court rank		0.0001 (0.0003)		
Different kyoku transfer	-0.0617* (0.0369)	-0.0342 (0.0341)	-0.6348*** (0.1145)	-41.5826*** (13.1447)
Observations	200	200	29	29
R^2	0.607	0.033	0.319	0.088

Notes: Sample consists of non-drafted workers who transferred to a draft-vacancy destination office-year. Draftee wage is measured as the drafted worker's wage percentile within occupation-by-year cells, then averaged across drafted workers in the destination office-year. The omitted category is a high relative-wage draftee destination, defined as at-or-above the median destination office-year draftee wage percentile. Heteroskedasticity-robust standard errors are in parentheses. *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$. Outcomes measure whether the transferee had to be elevated relative to baseline. Columns 1 and 2 control for the corresponding baseline rank. Salary columns use only workers with observed lagged salary, so they should be read as lower-powered robustness checks.
