Year FE				Yes		
Observations				5,989		
Log-likelihood	-3195.7				-5546.4	
AIC	6439.4				11188.7	

Notes: Multinomial logit. Sample restricted to origin office-unit $\times$ year cells that transferred at least one worker either to a different office-unit in the same kyoku or to a different kyoku, further restricted to workers with observed current-year salary. Columns 1–2 estimate the decomposition into within-kyoku and cross-kyoku transfers. Base category: stay in the same office-unit in the same ka and kyoku. Decoration and court rank are coded 0–8, where 0 is unobserved/no rank and higher values indicate higher rank. Specifications include year FE, tenure, and log current-year salary. Standard errors in parentheses. *** $p < 0.01$, ** $p < 0.05$, * $p < 0.10$.

Table 2: Selection into Draft-Induced Vacancies by Drafted-Worker Salary

	All draft vacancies		High-wage drafted workers		Low-wage drafted workers	
	Draft Vac.	Non-Draft	Draft Vac.	Non-Draft	Draft Vac.	Non-Draft
Decoration rank (0–8; high=better)	0.5177* (0.3129)	0.2717 (0.1992)	9.5178*** (0.0000)	0.2666 (0.1986)	-0.4570*** (0.0000)	0.2668 (0.1986)

AIC	6439.4		5005.1		4904.4	

Notes: Multinomial logit. Sample restricted to origin office-unit $\times$ year cells that transferred at least one worker either to a different ka within the same kyoku or to a different kyoku, and to workers with observed current-year salary. Columns 1–2 pool all draft-vacancy destinations. Columns 3–4 restrict the draft-vacancy destination to office-years where the mean salary of drafted workers is at or above the median among draft-vacancy office-years with observed drafted-worker salary; columns 5–6 use the below-median group. In columns 3–6, transfers to draft-vacancy office-years outside the indicated wage group are excluded. Base category: stayed in the same ka and kyoku. Decoration and court rank are coded 0–8, where 0 is unobserved/no rank and higher values indicate higher status. All specifications include year FE, tenure, and log current-year salary. Standard errors in parentheses. *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$.

Table 3: Selection into Draft-Induced Vacancies by Drafted-Worker Salary: Expanded Risk Sets

	Origin ka $\times$ year risk set			Origin kyoku $\times$ year risk set		
	High Draft	Low Draft	Non-Draft	High Draft	Low Draft	Non-Draft
Decoration rank (0–8; high=better)	20.8031*** (0.0000)	-12.8863*** (0.0000)	-6.1309*** (0.0000)	23.6450*** (0.0000)	-14.0499*** (0.0000)	-7.6652*** (0.0000)

Year FE	Yes					
Observations	332			335		
Log-likelihood	-291.8			-299.8		
AIC	619.6			635.7		

Notes: Multinomial logit. Columns 1–3 define candidate workers within origin ka-within-kyoku $\times$ year cells; columns 4–6 define candidate workers within origin kyoku $\times$ year cells. Risk-set cells are included if at least one worker transferred to a draft-vacancy office-year with observed drafted-worker salary. High and low draft vacancies split destination office-years by whether the mean monthly salary of drafted workers is at or above the median among draft-vacancy office-years with observed drafted-worker salary. Base category: not selected/stayed in the origin unit. Transfers to draft-vacancy office-years with missing drafted-worker salary are excluded. Decoration and court rank are coded 0–8, where 0 is unobserved/no rank and higher values indicate higher status. All specifications include year FE, tenure, and log current-year salary. Standard errors in parentheses. *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$.

Table 4: Selection into Draft-Induced Vacancies by Destination Draftee Salary

	All destinations		High-wage draftee destination		Low-wage draftee destination	
	Draft	Non-Draft	Draft	Non-Draft	Draft	Non-Draft
Decoration rank (0–8; high=better)	2.6231 (4.4666)	0.2662 (0.1986)	9.5178*** (0.0000)	0.2666 (0.1986)	-0.4570*** (0.0000)	0.2668 (0.1986)
Court rank (0–8; high=better)	0.3328 (0.5124)	-0.0665 (0.0580)	0.3011 (0.5242)	-0.0664 (0.0580)	0.3736 (0.4527)	-0.0664 (0.0579)
Female	-0.0024 (0.8369)	0.5876** (0.2474)	-0.3896 (0.8970)	0.5917** (0.2475)	0.8835 (0.9412)	0.5912** (0.2475)
Tenure (yrs)	-0.0996*** (0.0375)	0.0426*** (0.0124)	-0.0958** (0.0401)	0.0426*** (0.0124)	-0.1420*** (0.0484)	0.0424*** (0.0123)
Log salary (current year)	-0.4397** (0.1947)	-0.2577*** (0.0920)	-0.2436 (0.1957)	-0.2570*** (0.0918)	-0.8526*** (0.2335)	-0.2586*** (0.0921)
Year FE			Yes			
Observations	5,767		5,692		5,555	
Log-likelihood	-2489.4		-2478.5		-2428.2	
AIC	5026.7		5005.1		4904.4	

Notes: Multinomial logit. Sample uses the broad restricted transfer-out office-unit $\times$ year risk set and workers with observed current-year salary. Columns 1–2 split transfers into drafted and non-drafted destination office-years. Columns 3–4 keep drafted destinations whose drafted workers have at-or-above-median mean salary, plus non-drafted destinations. Columns 5–6 analogously use below-median drafted-worker salary destinations plus non-drafted destinations. Transfers to draft-vacancy office-years with missing drafted-worker salary are excluded. Base category: not selected/stayed in the same ka and kyoku. Decoration and court rank are coded 0–8, where 0 is unobserved/no rank and higher values indicate higher status. All specifications include year FE, tenure, and log current-year salary. Standard errors in parentheses. *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$.

Table 5: Selection into 1944 Destinations by Destination Draftee Salary

	All destinations		High-wage draftee destination		Low-wage draftee destination	
	Draft	Non-Draft	Draft	Non-Draft	Draft	Non-Draft
Decoration rank (0–8; high=better)	-0.1441 (0.5346)	-0.2383 (0.6675)	0.0389 (0.5392)	-0.2268 (0.6663)	-1.1910 (0.8865)	-0.6273 (0.6018)
Court rank (0–8; high=better)	0.2071 (0.2195)	0.1904 (0.2289)	0.2276 (0.2222)	0.1935 (0.2301)	0.1766 (0.2303)	0.1923 (0.2348)
Female	0.0481 (0.5334)	0.6143 (0.5590)	-0.6959 (0.5768)	0.5942 (0.5585)	0.4434 (0.5423)	0.6160 (0.5588)
Tenure (yrs)	-0.0435* (0.0225)	-0.0307 (0.0254)	-0.0361 (0.0234)	-0.0266 (0.0255)	-0.0500** (0.0236)	-0.0325 (0.0254)
Log salary (current year)	0.2466*** (0.0702)	0.6037*** (0.0931)	0.2995*** (0.0737)	0.5630*** (0.0907)	0.2490*** (0.0770)	0.6749*** (0.0996)
Observations	1,741		1,068		988	
Log-likelihood	-1156.1		-917.7		-875.5	
AIC	2336.2		1859.4		1775.0	

Notes: Multinomial logit. Choice sets are defined by all workers' baseline ka $\times$ occupation cells from 1943 Tokyo Shi and 1941 Tokyo Fu rosters. Outcomes and salaries are measured from the worker's 1944 assignment; Tokyo Fu baseline workers therefore use their 1944 salary. A worker is selected if assigned to a different 1944 ka; when 1944 ka is missing, office assignment is used instead. Columns 1–2 split 1944 transfers into drafted and non-drafted destination office-years. Columns 3–4 keep drafted destinations whose drafted workers have at-or-above-median mean salary, plus non-drafted destinations. Columns 5–6 analogously use below-median drafted-worker salary destinations plus non-drafted destinations. Base category: not selected from the baseline ka-occupation choice set. Decoration and court rank are baseline values coded 0–8, where 0 is unobserved/no rank and higher values indicate higher status. All specifications include tenure and log 1944 salary. Standard errors in parentheses. *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$.

Table 6: Salary and Rank Boosts for Non-Drafted Transferees into Draft-Vacancy Destinations

	High-wage draftee	Low-wage draftee	Low – High
Transferees	155	45	-110
With baseline salary	20	9	-11
Current salary	91.73	57.96	-33.77
Baseline salary	84.40	90.56	6.16
Salary change	-23.45	-50.44	-26.99
Median salary change	4.50	-42.00	-46.50
Log salary change	-0.812	-1.605	-0.793
Share with salary increase	55.0%	22.2%	-32.8%
Position-rank change	0.071	0.156	0.085
Share with position-rank boost	7.7%	26.7%	18.9%
Court-rank change	-0.123	-0.178	-0.055
Share with court-rank boost	0.6%	0.0%	-0.6%

Notes: Sample consists of non-drafted workers who transferred to a draft-vacancy destination office-year with observed drafted-worker salary, using the same destination wage split as Model G. High-wage draftee destinations are office-years where the mean salary of drafted workers is at or above the median among draft-vacancy office-years with observed drafted-worker salary; low-wage destinations are below that median. Salary changes compare current-year salary to the worker’s own baseline (lagged) salary, so those rows use only transferees with observed baseline salary. Position rank is coded 1–3 from title hierarchy; court rank is coded 0–8 with higher values indicating higher status. Rank-change rows code missing ranks as 0, matching the MNL convention.

Table 7: Low-Wage Draftee Destinations and Position-Rank Boosts

	Position-rank boost		Position-rank change	
	(1)	(2)	(3)	(4)
Low-wage draftee destination	0.1892*** (0.0697)	0.1045*** (0.0380)	0.0846 (0.0919)	0.0008 (0.0627)
Female		0.0268 (0.1226)		-0.0360 (0.1683)
Tenure (yrs)		-0.0055 (0.0034)		0.0001 (0.0047)
Baseline position rank		-0.5916*** (0.0821)		-0.6746*** (0.0945)
Different kyoku transfer		-0.0251 (0.0361)		-0.0029 (0.0610)
Controls	No	Yes	No	Yes
Observations	200	200	200	200
R^2	0.059	0.607	0.009	0.485

Notes: Sample consists of non-drafted workers who transferred to a draft-vacancy destination office-year with observed drafted-worker salary, using the same destination wage split as Model G. Columns 1–2 estimate linear probability models for whether the transferee’s position rank increased relative to baseline. Columns 3–4 estimate the level change in position rank. The omitted category is high-wage draftee destination. Controls include gender, tenure, baseline position rank, and an indicator for cross-kyoku transfer. Heteroskedasticity-robust standard errors are in parentheses. *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$.

Table 8: Replacement Quality by Relative Draftee Wage

	Baseline wage percentile (1)	Baseline salary (2)	Baseline position rank (3)	Baseline court rank (4)
Low relative-wage draftee destination	-0.1423 (0.0909)	-7.4901 (12.0346)	0.0449 (0.0522)	0.0870 (0.1546)
Female			-0.4266*** (0.1542)	-0.1535 (0.1019)
Tenure (yrs)	-0.0031 (0.0162)	-0.1247 (2.1198)	0.0263*** (0.0065)	-0.0015 (0.0153)
Different kyoku transfer	-0.1435 (0.1248)	-7.5658 (7.8690)	0.0209 (0.0786)	0.1493** (0.0753)
Observations	29	29	200	200
R^2	0.146	0.036	0.168	0.006

Notes: Sample consists of non-drafted workers who transferred to a draft-vacancy destination office-year. Draftee wage is measured as the drafted worker's wage percentile within occupation-by-year cells, then averaged across drafted workers in the destination office-year. The omitted category is a high relative-wage draftee destination, defined as at-or-above the median destination office-year draftee wage percentile. Heteroskedasticity-robust standard errors are in parentheses. *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$. Outcomes measure the transferee's pre-transfer quality using lagged/baseline characteristics. Baseline wage percentile is measured within the transferee's own baseline occupation-year. Baseline salary columns use only workers with observed lagged salary.

Table 9: Stretch and Misallocation by Relative Draftee Wage

	Position-rank boost (1)	Court-rank boost (2)	Salary increase (3)	Salary change (4)
Low relative-wage draftee destination	0.0871*** (0.0273)	-0.0064 (0.0065)	-0.2359 (0.1688)	4.1055 (22.5845)
Female	0.0383 (0.1216)	-0.0087 (0.0097)		
Tenure (yrs)	-0.0052 (0.0033)	-0.0005 (0.0005)	-0.0379* (0.0215)	-1.7473 (3.6480)
Baseline position rank	-0.6099*** (0.0800)			
Baseline court rank		0.0001 (0.0003)		
Different kyoku transfer	-0.0617* (0.0369)	-0.0342 (0.0341)	-0.6348*** (0.1145)	-41.5826*** (13.1447)
Observations	200	200	29	29
R^2	0.607	0.033	0.319	0.088

Notes: Sample consists of non-drafted workers who transferred to a draft-vacancy destination office-year. Draftee wage is measured as the drafted worker's wage percentile within occupation-by-year cells, then averaged across drafted workers in the destination office-year. The omitted category is a high relative-wage draftee destination, defined as at-or-above the median destination office-year draftee wage percentile. Heteroskedasticity-robust standard errors are in parentheses. *** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$. Outcomes measure whether the transferee had to be elevated relative to baseline. Columns 1 and 2 control for the corresponding baseline rank. Salary columns use only workers with observed lagged salary, so they should be read as lower-powered robustness checks.
